

Outlook Rules (.RWZ) File Format

1. Introduction

The Outlook Rules (.rwz) File Format is used to store an export of Outlook rules.

1.1. Glossary

Little-endian: Multiple-byte values that are byte-ordered with the least significant byte stored in the memory location with the lowest address.

Timestamp: A variant time is stored as an 8-byte real value (double), representing a date between January 1, 100 and December 31, 9999, inclusive. The value 2.0 represents January 1, 1900; 3.0 represents January 2, 1900, and so on. Adding 1 to the value increments the date by a day. The fractional part of the value represents the time of day. Therefore, 2.5 represents noon on January 1, 1900; 3.25 represents 6:00 A.M. on January 2, 1900, and so on. Negative numbers represent dates prior to December 30, 1899. The variant time resolves to one second. Any milliseconds in the input date are ignored.

UTF-16: A standard for encoding Unicode characters, defined in the Unicode standard, in which the most commonly used characters are defined as double-byte characters. Unless specified otherwise, this term refers to the UTF-16 encoding form specified in [UNICODE5.0.0/2007] section 3.9.

1.3. Overview

A rules file is a structure that is used to store a list of rules into a single file or memory buffer. A rule consists of a list of conditions, actions and exceptions that are defined in this specification.

In a rules file, all integer fields, including Unicode characters that are encoded in UTF-16, MUST be stored in **little-endian** byte order.

Header (50 bytes): [RulesHeader](#) containing information that defines the characteristics of the rules file, including the number of rules it holds.

Rules (variable): An array of [Rule](#) objects of length **Header.Number of Rules**.

Footer (variable): [RulesFooter](#) containing information that defines the characteristics of the rules file, including timestamp information.

2.1. RulesHeader

The header for the top-level of the .rwz file. This structure contains information such as the number of rules contained in the file.

Header (variable): [RuleHeader](#) contains information that defines the characteristics of the rules file, including its name, enabled status and the number of rule elements it holds.

Rule Elements (variable): An array of [RuleElement](#) values of length **Header.Number of Rule Elements**. Elements specify the type of messages to which the rule applies as well as the rule's conditions, actions and exclusions.

The observed order of elements is 0x00000190, 0x00000064, conditions, triggers, exceptions. Each element MUST be delineated with a 2-byte separator 0x8001.

2.3. RuleHeader

The header for an individual rule contained within the .rwz file. This structure contains information such as the rule's name, enabled status and the number of rule elements it holds.
